

Day Two:

Create a React app using Vite via ``npm create vite@latest``:

- Follow the CLI to choose React and Typescript.
- Create a **login** page that have a form with username and password, store the username and password in a local object to check them locally no need for API.
- Use right hook to handle the form state and submission also handle validation like no empty inputs.
- When user successfully login render the Dashboard.
- Create a **Dashboard** page that have this cards:
 - Counter Card with button and value preview each button click increment by one.
 - Timer Card that can start, pause or reset.
 - Notes Card that have can be checked as Done and change card note color to green on Done and add a cross line on the text
